

Regular full backups strategy

	✓ Pros	✗ Cons
Regular backups	<ul style="list-style-type: none"> • Easy to implement • Does not increase computational load 	<ul style="list-style-type: none"> • Requires an important storage space (usually several Gb) • Information is only recovered in post-treatment
Live tracking	<ul style="list-style-type: none"> • Strongly reduces storage space requirements • Provides live access to information 	<ul style="list-style-type: none"> • Increases computational load (tree's pruning and shortening) • Increases live memory load (tree's nodes must be stored in memory)

Live tracking strategy
