

# Regular full backups strategy

Regular backups	<p>✓ Pros</p> <ul style="list-style-type: none"><li>• Easy to implement</li><li>• Does not increase computational load</li></ul>	<p>✗ Cons</p> <ul style="list-style-type: none"><li>• Requires an important storage space (usually several Gb)</li><li>• Information is only recovered in post-treatment</li></ul>
	<p>Live tracking</p> <ul style="list-style-type: none"><li>• Strongly reduces storage space requirements</li><li>• Provides live access to information</li></ul>	<ul style="list-style-type: none"><li>• Increases computational load (tree's pruning and shortening)</li><li>• Increases live memory load (tree's nodes must be stored in memory)</li></ul>

# Live tracking strategy
